Archimedes principle tells us that the buoyant force on the ball is equal to the weight of that water: $14,130 \text{ cm}^3$ of

Read PDF Archimedes Principle Problems And Solutions

water = 14,130 grams = 14.13 kg
weight = mass \times force of gravity per kg
= (14.13 kg) \times 9.8 N/kg = 138 N If the
buoyant force is pushing up with 138 N,
and the weight of the ball is only 1.5 N,
your pushing down on the ball supplies
the rest of the force, 136.5 N.

Read PDF Archimedes Principle Problems And Solutions

Formula, Derivation ...

The general method for solving a typical buoyancy problem is based on the method we used in chapter 3 for solving a problem involving Newton's Laws. Now, we include Archimedes' principle. In general buoyancy problems are 1-dimensional, involving vertical forces, so that simplifies the method a little.
