PBM is especially useful for simulation of non-linear phenomena such as harmonic balance analysis, phase noise analysis, eye diagrams etc. Any application involving large signal space (i.e. transient simulations for VCOs, linearity of LNAs, PAs, clocking circuits etc.) is a prime candidate for the PBM™ solution. How it Works

The built-in equivalent circuits are illustrated in the following figure. Here Boukamp's simple notation of circuits [5] is used in the "trivial term", while "Simulation function" describes the function that needs to be called to perform simulations, and "Fit string" describes a circuit string that needs be called in the fitting function.

Results of research in the last two decades provide optimism that such a very high performance non-linear circuit simulator can be formulated. As an example, an advanced circuit solver approach (IREEDA), from North Carolina State University, is described in ref. 1, which has a dynamic range exceeding 160 dB in transient simulation.
