Gas Turbine vs Steam Turbine. Turbines are a class of turbo machinery used to convert the energy in a flowing fluid into mechanical energy by the use of rotor mechanisms. Turbines, in general, convert either thermal or kinetic energy of the fluid into work. Gas turbines and steam turbines are thermal turbo machinery, where the work is generated

The gas turbine can be used in combination with a steam turbine—in a combined-cycle power plant—to create power extremely efficiently. Air-fuel mixture ignites. The gas turbine compresses air and mixes it with fuel that is then burned at extremely high temperatures, creating a hot gas. Hot

Steam turbine - Wikipedia

Combined gas and steam (COGAS) is the name given to marine compound powerplants comprising gas and steam turbines, the latter being driven by steam generated using the heat from the exhaust of the gas turbines. In this
